Notes of HTML

Session-1

HTML

Introduction

HTML is the standard language used to create and structure content on the web. It is a markup language that uses elements (tags) to define the structure, content, and layout of a webpage.

WHERE ARE HTML FILES EXECUTED?

HTML files are executed in web browsers. The browser reads the HTML file, interprets its tags, and displays the content as a structured webpage.

SEMANTIC vs NON-SEMANTIC TAGS

1. Semantic Tags:

Semantic tags clearly describe the meaning of the content they contain. These tags make the HTML code more readable and help browsers understand the structure of the webpage.

2. Non-Semantic Tags:

Non-semantic tags do not describe the content they contain. They are used purely for structural purposes and do not provide any meaning about the content.

Image

BASIC HTML TAGS

Tag Name	Description	When to Use
<!DOCTYPE>	Declares the document type and version of HTML.	Use at the very beginning of the HTML document to specify which version of HTML the document is using (e.g., <!DOCTYPE html> for HTML5).
<html>	Represents the root element of an HTML document.	Wraps the entire content of the HTML document, except for the DOCTYPE declaration.
<head>	Contains metadata and links to external resources (stylesheets, scripts).	Use to include things like title, character encoding, stylesheets, and meta-information like author or viewport settings.
<title>	Specifies the title of the HTML document, which appears in the browser tab.	Place inside the <head> tag to define the title of the webpage, which is visible in the browser's title bar or tab.
<body>	Defines the body of the document, containing the visible content.	Use to wrap all the content visible to the user, such as text, images, and other elements, excluding the metadata.

Video

0:00 / 0:17

A horizontal progress bar for an audio player, showing the current position at 0:00 out of a total duration of 0:17.

Audio

0:00 / 2:02
